## The Potts model

#### • Let G = (V, E) be a finite undirected graph.

◆□ ▶ ◆□ ▶ ◆ 三 ▶ ◆ 三 ● の < ⊙

# The Potts model

- Let G = (V, E) be a finite undirected graph.
- The partition function of the q-state Potts model is

$$Z_G(q, \mathbf{t}) = \sum_{A \subseteq E} q^{k(A)} \prod_{e \in \mathbb{Z}_A} t_e,$$

where k(A) is the number of connected components of the subgraph (V, A).

## The Potts model

- Let G = (V, E) be a finite undirected graph.
- The partition function of the q-state Potts model is

$$Z_G(q, \mathbf{t}) = \sum_{A \subseteq E} q^{k(A)} \prod_{e \in E_A} t_e,$$

where k(A) is the number of connected components of the subgraph (V, A).

►  $Z_G(q, \mathbf{t})$  defines a probability distribution on subsets of E: Let X be a random subset of E. Then

$$\mathbb{P}[X=A] = \frac{1}{Z_G(q,\mathbf{t})} \cdot q^{k(A)} \prod_{e \in E} t_e, \qquad t_e, q \ge 0.$$

 $\blacktriangleright$   $\mathbb{P}$  is called the Fortuin-Kasteleyn random cluster model.

- Positive dependence models attracting particles,
- Negative dependence models repelling particles.

- Positive dependence models attracting particles,
- Negative dependence models repelling particles.
- For  $q \ge 1$ , the Potts model is positively dependent.

▲□▶ ▲□▶ ▲ □▶ ★ □▶ □ のへで

- Positive dependence models attracting particles,
- Negative dependence models repelling particles.
- For  $q \ge 1$ , the Potts model is positively dependent.
- For  $0 < q \le 1$ , it is conjectured to be negatively dependent.

▶ Negative correlations: For distinct  $i, j \in E$ ,

 $\mathbb{P}[i, j \in X] \le \mathbb{P}[i \in X] \cdot \mathbb{P}[j \in X].$ 

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ の < @

 for all  $\mathbf{x} \in \mathbb{R}^n$  and  $\mathbf{w} \in L_{\mathcal{C}}$ ,

2.  $D_{\mathbf{v}_1}\cdots D_{\mathbf{v}_d}f > 0$  for all  $\mathbf{v}_1,\ldots,\mathbf{v}_d \in \mathfrak{C}$ ,

A matrix A = (a<sub>ij</sub>)<sup>n</sup><sub>i,j=1</sub> whose off-diagonal elements are nonnegative is called irreducible if for each i ≠ j there is a path i = i<sub>0</sub> ≠ i<sub>1</sub> ≠ ··· ≠ i<sub>ℓ</sub> = j such that a<sub>ikik+1</sub> ≠ 0.

Theorem (B., Leake). Suppose f has degree  $d \ge 3$ , and that  $\mathcal{C}$  is effective. If the following conditions hold, then f is  $\mathcal{C}$ -Lorentzian:

- 1.  $f(\mathbf{x} + \mathbf{w}) = f(\mathbf{x})$  for all  $\mathbf{x} \in \mathbb{R}^n$  and  $\mathbf{w} \in L_c$ ,
- 2.  $D_{\mathbf{v}_1} \cdots D_{\mathbf{v}_d} f > 0$  for all  $\mathbf{v}_1, \dots, \mathbf{v}_d \in \mathfrak{C}$ ,
- 3. the Hessian of  $D_{\mathbf{v}_1} \cdots D_{\mathbf{v}_{d-2}} f$  is irreducible and its off-diagonal entries are nonnegative for all  $\mathbf{v}_1, \ldots, \mathbf{v}_{d-2} \in \mathcal{C}$ ,

A matrix A = (a<sub>ij</sub>)<sup>n</sup><sub>i,j=1</sub> whose off-diagonal elements are nonnegative is called irreducible if for each i ≠ j there is a path i = i<sub>0</sub> ≠ i<sub>1</sub> ≠ ··· ≠ i<sub>ℓ</sub> = j such that a<sub>ikik+1</sub> ≠ 0.
