

## FORMAL MULTIPARAMETER QUANTUM GROUPS, DEFORMATIONS AND SPECIALIZATIONS

GASTÓN ANDRÉS GARCÍA<sup>✉</sup>, FABIO GAVARINI<sup>✉</sup>

**ABSTRACT.** We introduce the notion of *formal multiparameter QUEA* — in short *FoMpQUEA* — as a straightforward generalization of Drinfeld’s quantum group  $U_h(\mathfrak{g})$ . Then we show that the class of FoMpQUEA’s is closed under deformations by (“toral”) twists and deformations by (“toral”) 2-cocycles: as a consequence, all “multiparameter formal QUEA’s” considered so far are recovered, as falling within this class. In particular, we prove that any FoMpQUEA is isomorphic to a suitable deformation, by twist or by 2-cocycle, of Drinfeld’s standard QUEA.

We introduce also multiparameter Lie bialgebras (in short, MpLbA’s), and we consider their deformations, by twist and by 2-cocycles. The semiclassical limit of every FoMpQUEA is a suitable MpLbA, and conversely each MpLbA can be quantized to a suitable FoMpQUEA. In the end, we prove that, roughly speaking, the two processes of “specialization” — of a FoMpQUEA to a MpLbA — and of “deformation (by toral twist or toral 2-cocycle)” — at the level of FoMpQUEA’s or of MpLbA’s — do commute with each other.
