All'inizio degli anni '90....

“Il **World Wide Web** ravviva **Internet**, fino allora *solo-testo*, con immagini, suoni e filmati. Milioni di persone accedono a Internet per lavoro, studio e divertimento.”

World Wide Web

The WorldWideWeb (W3) is a wide-area [hypermedia](#) information retrieval initiative aiming to give universal access to a large universe of documents.

Everything there is online about W3 is linked directly or indirectly to this document, including an [executive summary](#) of the project, [Mailing lists](#) , [Policy](#) , November's [W3 news](#) , [Frequently Asked Questions](#) .

[What's out there?](#)

Pointers to the world's online information, [subjects](#) , [W3 servers](#), etc.

[Help](#)

on the browser you are using

[Software Products](#)

A list of W3 project components and their current state. (e.g. [Line Mode](#) ,X11 [Viola](#) , [NeXTStep](#) , [Servers](#) , [Tools](#) ,[Mail robot](#) ,[Library](#))

[Technical](#)

Details of protocols, formats, program internals etc

[Bibliography](#)

Paper documentation on W3 and references.

[People](#)

A list of some people involved in the project.

[History](#)

A summary of the history of the project.

[How can I help ?](#)

If you would like to support the web..

[Getting code](#)

Getting the code by [anonymous FTP](#) , etc.

Marzo-aprile 1994: il **World Wide Web Worm**
un indice di 110.000/150.000 pagine
circa 1500 ricerche al giorno

Novembre 1997: i migliori motori di ricerca
un indice fra 2.000.000 e 100.000.000 pagine
circa 20.000.000 ricerche al giorno

Oggi:

il World Wide Web contiene milioni di milioni di documenti.

Senza un buon criterio per ordinare i risultati di una ricerca
l'informazione cercata è sommersa
in un mare di risultati irrilevanti.

Il 27 settembre 1998, appare Google

Search the web using Google!

1 googol =

$$1.0 \times 10^{100}$$

... visto da Hydro Yot ...

Presto Google diventa il motore di ricerca più usato.

Google presenta i risultati più rilevanti in testa.

Il segreto di Google ?

l'algoritmo PageRank,

che calcola il grado di rilevanza di ogni pagina del web.

Due miti da sfatare

Le pagine importanti sono le **più visitate**?
FALSO!

Sono quelle che hanno **più link** da altre pagine?
FALSO!

Da cosa dipende la rilevanza di una pagina?

Dipende dalla rilevanza
delle pagine che hanno un link verso di essa.

SEARCH STARTS WITH THE WEB. IT'S MADE UP OF OVER

130 TRILLION INDIVIDUAL PAGES

AND IT'S CONSTANTLY GROWING.

Google scans e indicizza le pagine del Web

Google conta i link IN & OUT di ogni pagina

We sort the pages
by their content
and other factors.

$P_1, \dots, P_m$ le pagine del web

L'algoritmo **PageRank** assegna ad ogni pagina un numero $x_i \geq 0$

x_i = “grado di rilevanza” della pagina P_i

$$x_1 + x_2 + \dots + x_m = 1$$

x_i grande $\Leftrightarrow$ pagina P_i importante.

La rilevanza di una pagina è data dalla *somma pesata delle rilevanze delle pagine che hanno un link verso di essa.....*

N.B.: i link a se stessi non contano...!!!

$$x_i = \sum_{j \neq i} \frac{1}{n_j} x_j,$$

dove j indica le pagine P_j che puntano verso P_i ,
ed n_j è il numero di link da P_j verso altre pagine.

$$x_1 = 0 \cdot x_1 + 0 \cdot x_2 + 1 \cdot x_3$$

$$x_2 = \frac{1}{2} \cdot x_1 + 0 \cdot x_2 + 0 \cdot x_3$$

$$x_3 = \frac{1}{2} \cdot x_1 + 1 \cdot x_2 + 0 \cdot x_3$$

Soluzioni: $x_1 = x_3$, $x_1 = \frac{1}{2}x_2$

Con la condizione $x_1 + x_2 + x_3 = 1$,

soluzione unica $x_1 = x_3 = 0.4$, $x_2 = 0.2$.

I numeri

$$x_1, x_2, \dots, x_m, \quad x_1 + \dots + x_m = 1$$

sono soluzioni di un sistema lineare:

$$\begin{aligned} x_1 &= && \frac{1}{n_2}x_2 + \frac{1}{n_3}x_3 + \dots \\ x_2 &= \frac{1}{n_1}x_1 + && + \frac{1}{n_3}x_3 + \dots \\ &\vdots = &\vdots &\vdots && \vdots &\dots \\ x_m &= \frac{1}{n_1}x_1 + \frac{1}{n_2}x_2 + \frac{1}{n_3}x_3 + \dots \end{aligned}$$

LA TEORIA: *per i sistemi di questo tipo*

$x_1, x_2, \dots, x_m$ sono univocamente determinati.

Proviamo **PageRank** su un altro mini-esempio:

Ci sono 5 pagine: P_1, P_2, P_3, P_4, P_5

$$n_1 = 4, \quad n_2 = 2, \quad n_3 = 1, \quad n_4 = 3, \quad n_5 = 1.$$

$$x_1 = \frac{1}{2}x_2 + \frac{1}{3}x_4$$

$$x_2 = \frac{1}{4}x_1 + \frac{1}{3}x_4$$

$$x_3 = \frac{1}{4}x_1 + \frac{1}{2}x_2 + \frac{1}{3}x_4$$

$$x_4 = \frac{1}{4}x_1 + x_3 + x_5$$

$$x_5 = \frac{1}{4}x_1$$

Risolvendo il sistema troviamo:

$$x_4 = 0.33, \quad x_3 = 0.26,$$

$$x_1 = 0.19, \quad x_2 = 0.16, \quad x_5 = 0.04.$$

Nel linguaggio dell'**ALGEBRA LINEARE**

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix}$$

è un **AUTOVETTORE** della matrice

$$\begin{pmatrix} 0 & 1/2 & 0 & 1/3 & 0 \\ 1/4 & 0 & 0 & 1/3 & 0 \\ 1/4 & 1/2 & 0 & 1/3 & 1/2 \\ 1/4 & 0 & 1 & 0 & 1/2 \\ 1/4 & 0 & 0 & 0 & 0 \end{pmatrix}$$

La matrice di Google è immensa....

$$N \times N, \quad N > 60 \cdot 10^{12}$$

Calcolare l'autovettore di Google richiede giorni.

THE \$25,000,000,000* EIGENVECTOR THE LINEAR ALGEBRA BEHIND GOOGLE

KURT BRYAN[†] AND TANYA LEISE[‡]

Abstract. Google's success derives in large part from its PageRank algorithm, which ranks the importance of webpages according to an eigenvector of a weighted link matrix. Analysis of the PageRank formula provides a wonderful applied topic for a linear algebra course. Instructors may assign this article as a project to more advanced students, or spend one or two lectures presenting the material with assigned homework from the exercises. This material also complements the discussion of Markov chains in matrix algebra. Maple and Mathematica files supporting this material can be found at www.rose-hulman.edu/~bryan.

Key words. linear algebra, PageRank, eigenvector, stochastic matrix

AMS subject classifications. 15-01, 15A18, 15A51

Il secondo classificato ha solo un link in arrivo...ma molto importante...

Sul web si trovano diversi programmi che dicono di saper calcolare il **PageRank** di qualunque sito:
