

Modello di Henry-Hellès

$$H(\underline{y}, \underline{x}) = \frac{1}{2} \omega_1 (x_1^2 + y_1^2) + \frac{1}{2} \omega_2 (x_2^2 + y_2^2) \\ + \cancel{X_1^2 X_2} - \frac{X_2^3}{3}$$

termine di
accoppiamento
tra (y_1, x_1) e (y_2, x_2)

senza accoppiamento $H(\underline{y}, \underline{x}) = H_1(y_1, x_1) + H_2(y_2, x_2)$

momentaneamente
perso

dove $H_1(y_1, x_1) = \frac{\omega_1}{2}(x_1^2 + y_1^2)$

La sezione di Poincaré $\bar{\Sigma}$ è data da

$$x_1 = 0, \quad \dot{x}_1 = \frac{\partial H_1}{\partial y_1} = \omega_1 y_1 > 0$$

inoltre $H_2(y_2, x_2) = \frac{\omega_2}{2}(x_2^2 + y_2^2) - \frac{x_2^3}{3}$

Siccome $\{H_1, H_2\} = 0$, $\{H_1, H\} = \{H_2, H\} = 0$

$\Rightarrow$ 2 cost. del moto in involuzione e quindi $\Rightarrow$ sist. NITGR.

Siccome $H_2(y_2, x_2)$ è cost. del moto allora $H_2(y_2, x_2) = E_2 = \overline{H_2(y_1(0), x_1(0))}$

Cost functione della forma usual
di Birkhoff con l'Hamiltoniana

$$L_0 = \omega_1 z_1 \bar{z}_1 + \omega_2 z_2 \bar{z}_2$$

$(\bar{z}_1, z_1)$ moment.
