

# ANALISI MATEMATICA 2 - LEZIONE 18

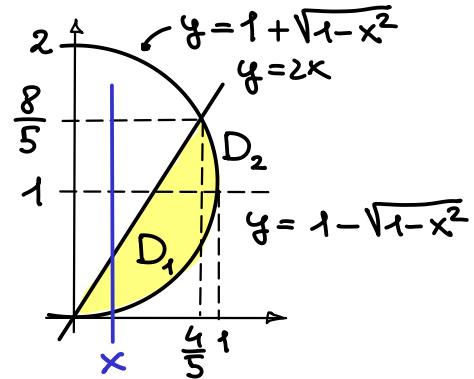

## ESEMPI

$$\bullet \iint_D x \, dx \, dy \quad D = \{(x, y) : 0 \leq y \leq 2x, x^2 + y^2 \leq 2y\}$$

$\downarrow x^2 + (y-1)^2 \leq 1$

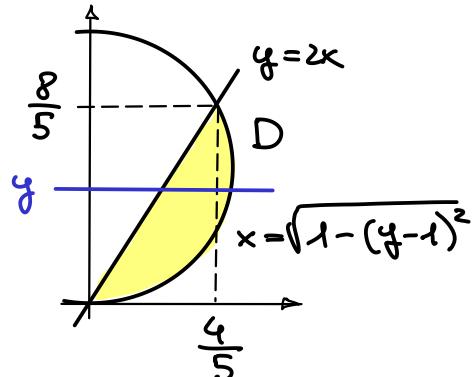

1)  $D = D_1 \cup D_2$  con  $D_1$  e  $D_2$   $y$ -semplifici

$$\begin{aligned} \iint_D x \, dx \, dy &= \iint_{D_1} x \, dx \, dy + \iint_{D_2} x \, dx \, dy \\ &= \left( \int_{x=0}^{4/5} \left( \int_{y=1-\sqrt{1-x^2}}^{2x} x \, dy \right) dx \right) + \left( \int_{x=4/5}^1 \left( \int_{y=1-\sqrt{1-x^2}}^{1+\sqrt{1-x^2}} x \, dy \right) dx \right) \\ &= \int_{x=0}^{4/5} x(2x - 1 + \sqrt{1-x^2}) dx + \int_{x=4/5}^1 2x\sqrt{1-x^2} dx \\ &= \left[ \frac{2x^3}{3} - \frac{x^2}{2} - \frac{1}{3}(1-x^2)^{3/2} \right]_0^{4/5} + \left[ -\frac{2}{3}(1-x^2)^{3/2} \right]_{4/5}^1 = \dots = \frac{32}{75}. \end{aligned}$$

2)  $D$  è  $x$ -semplifico

$$\begin{aligned} \iint_D x \, dx \, dy &= \int_{y=0}^{8/5} \left( \int_{x=\frac{y}{2}}^{\sqrt{1-(y-1)^2}} x \, dx \right) dy \\ &= \int_{y=0}^{8/5} \left[ \frac{x^2}{2} \right]_{\frac{y}{2}}^{\sqrt{1-(y-1)^2}} dy \end{aligned}$$

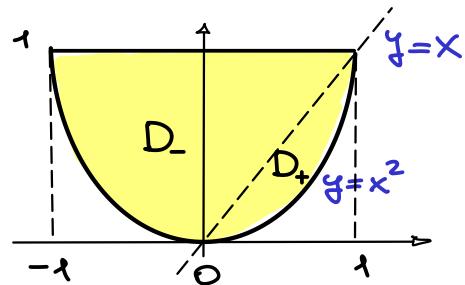

$$\begin{aligned} &= \frac{1}{2} \int_0^{8/5} \left( 1 - (y-1)^2 - \frac{y^2}{4} \right) dy = \frac{1}{2} \int_0^{8/5} (2y - \frac{5}{4}y^2) dy \\ &= \frac{1}{2} \left[ y^2 - \frac{5}{12}y^3 \right]_0^{8/5} = \frac{1}{2} \cdot \frac{64}{25} \left( 1 - \frac{5}{12} \cdot \frac{8}{5} \right) = \frac{32}{75}. \end{aligned}$$

$$\int \int \int |x-y| dx dy \quad D = \{(x,y) : x^2 \leq y \leq 1\}$$

$$D = D_+ \cup D_- \quad \begin{cases} x-y \geq 0 \\ x-y \leq 0 \end{cases}$$

$D_+$  è  $y$ -sempli'ce

$D_-$  è  $x$ -sempli'ce

$$\int \int \int |x-y| dx dy = \int \int_{D_+} (x-y) dx dy + \int \int_{D_-} (y-x) dx dy$$

$$= \int_{x=0}^1 \left( \int_{y=x^2}^x (x-y) dy \right) dx + \int_{y=0}^1 \left( \int_{x=-\sqrt{y}}^y (y-x) dx \right) dy$$

$$= \int_0^1 \left[ xy - \frac{y^2}{2} \right]_{x^2}^x dx + \int_0^1 \left[ yx - \frac{x^2}{2} \right]_{-\sqrt{y}}^y dy$$

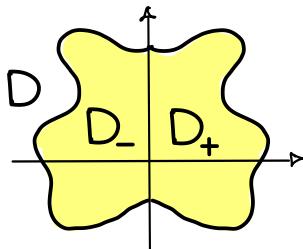

$$= \int_0^1 \left( x^2 - \frac{x^2}{2} - x^3 + \frac{x^4}{2} \right) dx + \int_0^1 \left( y^2 - \frac{y^2}{2} + y^3 + \frac{y^4}{2} \right) dy$$

$$= \left[ \frac{x^3}{6} - \frac{x^4}{4} + \frac{x^5}{10} \right]_0^1 + \left[ \frac{y^3}{6} + \frac{2}{5} y^5 + \frac{y^6}{4} \right]_0^1$$

$$= \frac{1}{6} - \frac{1}{4} + \frac{1}{10} + \frac{1}{6} + \frac{2}{5} + \frac{1}{4} = \frac{10+6+10+24}{60} = \frac{5}{6}.$$

### OSSERVAZIONE

Sia  $D$  un insieme simmetrico rispetto alla retta  $x=0$ :

dove  $D_+ = \{(x,y) \in D : x \geq 0\}$  e  $D_- = \{(x,y) \in D : x \leq 0\}$ .

1) Se  $f(x,y) = f(-x,y)$  ovunque  $f$  è  $x$ -PARI allora

$$\begin{aligned} \iint_D f(x,y) dx dy &= \iint_{D_+} f(x,y) dx dy + \iint_{D_-} f(x,y) dx dy \\ &= \iint_{D_+} f(x,y) dx dy + \iint_{D_+} f(-x,y) dx dy = 2 \iint_{D_+} f(x,y) dx dy \\ &\quad \text{f(x,y)} \end{aligned}$$

2) Se  $f(x,y) = -f(-x,y)$  ovunque  $f$  è  $x$ -DISPARI allora

$$\begin{aligned} \iint_D f(x,y) dx dy &= \iint_{D_+} f(x,y) dx dy + \iint_{D_-} f(x,y) dx dy \\ &= \iint_{D_+} f(x,y) dx dy + \iint_{D_+} -f(-x,y) dx dy = 0 \\ &\quad \text{-f(x,y)} \end{aligned}$$

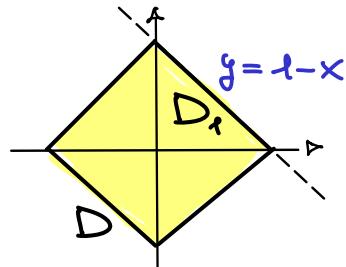

Analoghe relazioni valgono per domini simmetrici rispetto a  $y=0$  e funzioni  $y$ -pari o  $y$ -dispari.

- $\iint_D x(x+e^{x^2})|y| dx dy$  simmetrico rispetto a  $x=0$  e  $y=0$   $D = \{(x,y) : |x|+|y| \leq 1\}$

$$= \iint_D x^2|y| dx dy + \iint_D x e^{x^2}|y| dx dy$$

$x$ -pari  
 $y$ -pari

$x$ -dispari  
 $(y$ -pari)

$$= 4 \iint_{D_1} x^2|y| dx dy + 0 \text{ dove } D_1 = \{(x,y) : x \geq 0, y \geq 0, x+y \leq 1\}$$

$$= 4 \int_{x=0}^1 x^2 \left( \int_{y=0}^{1-x} y dy \right) dx = 4 \int_0^1 x^2 \left[ \frac{y^2}{2} \right]_0^{1-x} dx$$

$$= 2 \int_0^1 x^2 (1-x^2) dx = 2 \left[ \frac{x^5}{5} - 2 \frac{x^4}{4} + \frac{x^3}{3} \right]_0^1 = \frac{6-15+10}{15} = \frac{1}{15} .$$

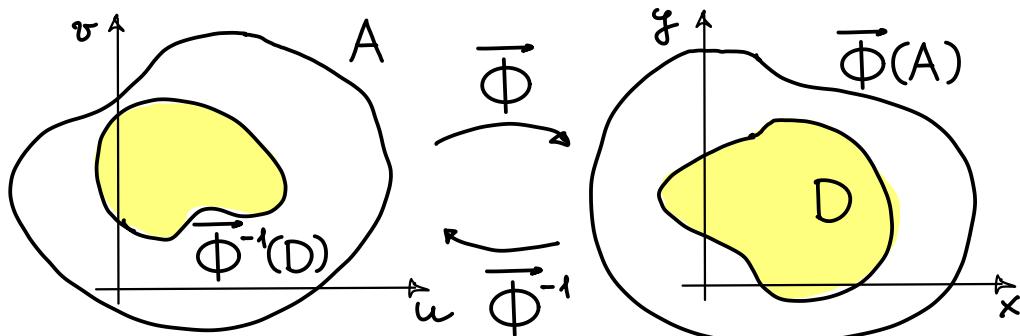

## CAMBIAMENTO DI VARIABILI PER INTEGRALI DOPPI

Alle volte in un integrale doppio le variabili "originali"  $(x, y)$  possono non agevolare il calcolo. Può essere allora utile effettuare un CAMBIAMENTO DI VARIABILI passando ad un nuovo sistema di coordinate  $(u, v)$ .

Indichiamo con  $\vec{\Phi}: A \rightarrow \vec{\Phi}(A)$

$$\vec{\Phi}(u, v) = (\underbrace{\varphi_1(u, v)}_{x}, \underbrace{\varphi_2(u, v)}_{y})$$

la funzione bimivoca che realizza il cambio dove  $A$  è un insieme aperto di  $\mathbb{R}^2$ .

con  $x = \varphi_1(u, v)$  e  $y = \varphi_2(u, v)$ .

Supponiamo che  $\varphi_1, \varphi_2 \in C^1(A)$  e consideriamo la MATRICE JACOBIANA di  $\vec{\Phi}$ .

$$J_{\vec{\Phi}}(u, v) = \begin{bmatrix} \frac{\partial \varphi_1}{\partial u}(u, v) & \frac{\partial \varphi_1}{\partial v}(u, v) \\ \frac{\partial \varphi_2}{\partial u}(u, v) & \frac{\partial \varphi_2}{\partial v}(u, v) \end{bmatrix}$$

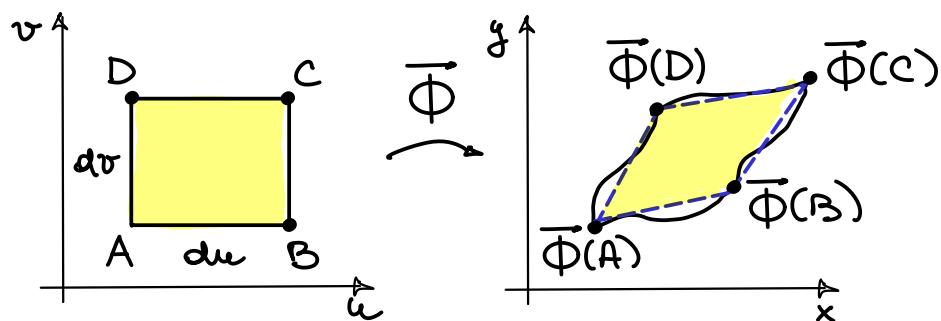

## TEOREMA (CAMBIO DI VARIABILI PER INTEGRALI DOPPI)

Sia  $\vec{\Phi}: A \rightarrow \vec{\Phi}(A)$  un cambio di variabili nelle ipotesi descritte sopra. Sia  $D$  un insieme limitato e misurabile contenuto in  $\vec{\Phi}(A)$  e sia  $f$  una funzione continua e limitata in  $D$ . Se  $\det(J_{\vec{\Phi}}(u, v)) \neq 0$  in  $\vec{\Phi}^{-1}(D) \setminus E$  con  $|E|=0$  allora

$$\iint_D f(x, y) dx dy = \iint_{\vec{\Phi}^{-1}(D)} f(\vec{\Phi}(u, v)) |\det(J_{\vec{\Phi}}(u, v))| du dv.$$

### OSSERVAZIONE

Il termine  $|\det(J_{\vec{\Phi}}(u, v))|$  rappresenta il fattore di trasformazione dell'elemento infinitesimo d'area  $du dv$

Area:  $du dv \xrightarrow{\vec{\Phi}} |\det(J_{\vec{\Phi}}(u, v))| du dv$   
 approssimazione lineare

Inoltre dato che

$$\begin{aligned} \vec{\Phi}(B) - \vec{\Phi}(A) &= \vec{\Phi}(u+du, v) - \vec{\Phi}(u, v) \\ &\sim \left( \frac{\partial \varphi_1}{\partial u}(u, v), \frac{\partial \varphi_2}{\partial u}(u, v) \right) du \end{aligned}$$

$$\begin{aligned} \vec{\Phi}(D) - \vec{\Phi}(A) &= \vec{\Phi}(u, v+dv) - \vec{\Phi}(u, v) \\ &\sim \left( \frac{\partial \varphi_1}{\partial v}(u, v), \frac{\partial \varphi_2}{\partial v}(u, v) \right) dv \end{aligned}$$

$$\vec{\Phi}(C) - \vec{\Phi}(D) = \vec{\Phi}(u+du, v+dv) - \vec{\Phi}(u, v+dv) \\ \sim \vec{\Phi}(B) - \vec{\Phi}(A)$$

$$\vec{\Phi}(C) - \vec{\Phi}(B) = \vec{\Phi}(u+du, v+dv) - \vec{\Phi}(u+du, dv) \\ \sim \vec{\Phi}(D) - \vec{\Phi}(A)$$

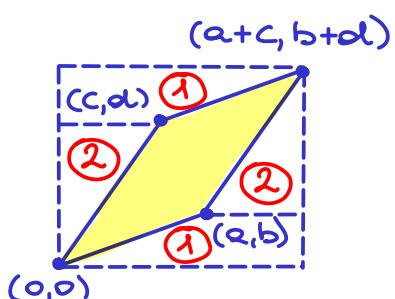

Quindi

$$\text{Area}(\vec{\Phi}(ABCD))$$

$\sim$  Area(parallelogramma con lati

$$\left( \frac{\partial \varphi_1(u,v)}{\partial u}, \frac{\partial \varphi_2(u,v)}{\partial u} \right) du \\ \left( \frac{\partial \varphi_1(u,v)}{\partial v}, \frac{\partial \varphi_2(u,v)}{\partial v} \right) dv \text{ e } )$$

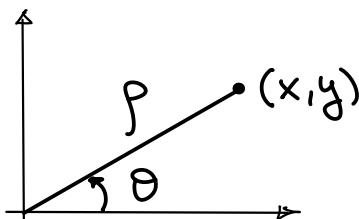

$$= \left| \det \begin{bmatrix} \frac{\partial \varphi_1}{\partial u}(u,v) & \frac{\partial \varphi_1}{\partial v}(u,v) \\ \frac{\partial \varphi_2}{\partial u}(u,v) & \frac{\partial \varphi_2}{\partial v}(u,v) \end{bmatrix} \right| du dv \\ = \left| \det(J_{\vec{\Phi}}(u,v)) \right| du dv.$$

Area(parallelogramma)

$$= (a+c) \cdot (b+d) - (2\textcircled{1} + 2\textcircled{2}) \\ = (ab + cb + ad + cd) - (b(a+2c) + cd) \\ = ad - cb = \det \begin{pmatrix} a & c \\ b & d \end{pmatrix}$$

Un esempio importante di cambio di variabili  
in dimensione due è il passaggio dalle coordinate  
cartesiane alle COORDINATE POLARI  $(\rho, \theta)$ :

$$\begin{cases} x = \rho \cos \theta \\ y = \rho \sin \theta \end{cases}$$

$$\rho = \sqrt{x^2 + y^2}$$

$$\theta \in [0, 2\pi)$$

tangolo principale

Poniamo  $x = \varphi_1(\rho, \theta) = \rho \cos \theta$ ,  $y = \varphi_2(\rho, \theta) = \rho \sin \theta$ .

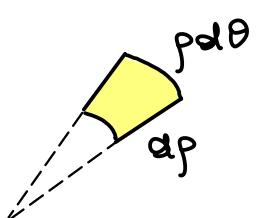

Allora le matrice jacobiana è

$$J_{\vec{\varPhi}}(\rho, \theta) = \begin{bmatrix} \frac{\partial \varphi_1}{\partial \rho} & \frac{\partial \varphi_1}{\partial \theta} \\ \frac{\partial \varphi_2}{\partial \rho} & \frac{\partial \varphi_2}{\partial \theta} \end{bmatrix} = \begin{bmatrix} \cos \theta & -\rho \sin \theta \\ \sin \theta & \rho \cos \theta \end{bmatrix}$$

e dunque  $|\det(J_{\vec{\varPhi}}(\rho, \theta))| = \rho \cos^2 \theta + \rho \sin^2 \theta = \rho$ . = 0 solo nell'origine

L'elemento infinitesimo d'area è

$$|\det(J_{\vec{\varPhi}}(\rho, \theta))| d\rho d\theta = \rho d\rho d\theta.$$

### ESEMPIO

$$\iint_D \frac{x}{(x^2+y^2)^2} dx dy \quad D = \{(x, y) : 0 \leq y \leq x, 1 \leq x^2+y^2 \leq 4\}.$$

$$= \iint_{\vec{\Phi}^{-1}(D)} \frac{\rho \cos \theta}{\rho^4} \cdot \rho d\rho d\theta$$

$$= \int_{\rho=1}^2 \left( \frac{1}{\rho^2} \int_{\theta=0}^{\pi/4} \cos \theta d\theta \right) d\rho$$

$$= \int_1^2 \frac{1}{\rho^2} \left[ \sin \theta \right]_0^{\pi/4} d\rho = \frac{1}{\sqrt{2}} \left[ -\frac{1}{\rho} \right]_1^2 = \frac{1}{\sqrt{2}} \left( -\frac{1}{2} + 1 \right) = \frac{1}{2\sqrt{2}}.$$
